Software Synthesis from Dataflow Graphs (The Springer International Series in Engineering and Computer Science) Shuvra S. Bhattacharyya, Praveen K. Murthy, Edward A. Lee

Software Synthesis from Dataflow Graphs addresses the problem of generating efficient software implementations from applications specified as synchronous dataflow graphs for programmable digital signal processors (DSPs) used in embedded real-time systems. The advent of high-speed graphics workstations has made feasible the use of graphical block diagram programming environments by designers of signal processing systems. A particular subset of dataflow, called Synchronous Dataflow (SDF), has proven efficient for representing a wide class of unirate and multirate signal processing algorithms, and has been used as the basis for numerous DSP block diagram-based programming environments such as the Signal Processing Workstation from Cadence Design Systems, Inc., COSSAP from Synopsys® (both commercial tools), and the Ptolemy environment from the University of California at Berkeley.

A key property of the SDF model is that static schedules can be determined at compile time. This removes the overhead of dynamic scheduling and is thus useful for real-time DSP programs where throughput requirements are often severe. Another constraint that programmable DSPs for embedded systems have is the limited amount of on-chip memory. Off-chip memory is not only expensive but is also slower and increases the power consumption of the system; hence, it is imperative that programs fit in the on-chip memory whenever possible.

Software Synthesis from Dataflow Graphs reviews the state-of-the-art in constructing static, memory-optimal schedules for programs expressed as SDF graphs. Code size reduction is obtained by the careful organization of loops in the target code. Data buffering is optimized by constructing the loop hierarchy in provably optimal ways for many classes of SDF graphs. The central result is a uniprocessor scheduling framework that provably synthesizes the most compact looping structures, called single appearance schedules, for a certain class of SDF graphs. In addition, algorithms and heuristics are presented that generate single appearance schedules optimized for data buffering usage. Numerous practical examples and extensive experimental data are provided to illustrate the efficacy of these techniques.

From reader reviews:

Guadalupe Baxter:

As people who live in the actual modest era should be update about what going on or details even knowledge to make them keep up with the era that is certainly always change and move ahead. Some of you maybe will probably update themselves by studying books. It is a good choice for yourself but the problems coming to you actually is you don't know what type you should start with. This Software Synthesis from Dataflow Graphs (The Springer International Series in Engineering and Computer Science) is our recommendation to help you keep up with the world. Why, because this book serves what you want and want in this era.

Luis Martin:

Do you one among people who can't read pleasurable if the sentence chained in the straightway, hold on guys this aren't like that. This Software Synthesis from Dataflow Graphs (The Springer International Series in Engineering and Computer Science) book is readable simply by you who hate those straight word style. You will find the info here are arrange for enjoyable reading experience without leaving possibly decrease the knowledge that want to offer to you. The writer associated with Software Synthesis from Dataflow Graphs (The Springer International Series in Engineering and Computer Science) content conveys the idea easily to understand by many individuals. The printed and e-book are not different in the articles but it just different as it. So , do you even now thinking Software Synthesis from Dataflow Graphs (The Springer International Series in Engineering and Computer Science) is not loveable to be your top list reading book?

Eric Kyler:

The reserve untitled Software Synthesis from Dataflow Graphs (The Springer International Series in Engineering and Computer Science) is the reserve that recommended to you to see. You can see the quality of the reserve content that will be shown to you. The language that creator use to explained their ideas are easily to understand. The copy writer was did a lot of exploration when write the book, so the information that they share to your account is absolutely accurate. You also can get the e-book of Software Synthesis from Dataflow Graphs (The Springer International Series in Engineering and Computer Science) from the publisher to make you far more enjoy free time.

Darlene Gutierrez:

As we know that book is significant thing to add our understanding for everything. By a guide we can know everything we would like. A book is a group of written, printed, illustrated or even blank sheet. Every year had been exactly added. This reserve Software Synthesis from Dataflow Graphs (The Springer International Series in Engineering and Computer Science) was filled concerning science. Spend your spare time to add your knowledge about your research competence. Some people has different feel when they reading a new book. If you know how big good thing about a book, you can experience enjoy to read a publication. In the

modern era like right now, many ways to get book that you wanted.
